Excel: Assignment 1

Basic Cleaning and Formula Foundations
Data preparation, simple formulas, and structured sheet setup

Dataset	Amazon bestselling novels, 2009-2020
Core fields	Name, Author, User Rating, Reviews, Price, Year, Genre
Expected outcome	A clean, structured workbook with formulas, analysis outputs, and written conclusions

Introduction

This assignment introduces students to the discipline of preparing raw spreadsheet data for analysis. The dataset contains Amazon bestselling novels from 2009-2020, and the objective is to convert unstructured rows into a clean, analysis-ready workbook.

Students will practice the habits expected in professional reporting environments: preserving a raw data sheet, creating helper columns, using formulas consistently, and writing concise observations from the cleaned output.

Learning Objectives

- Remove duplicates and establish a clean master sheet.
- Apply core Excel formulas for classification, rounding, and counting.
- Use text functions to extract and manipulate values from book titles.
- Summarize the dataset with a small genre-level report.

Student Instructions

1. Work in one workbook with clearly named sheets such as Raw Data, Clean Data, Analysis, and Final Answers.
2. Do not overwrite the original dataset. Maintain a separate raw sheet and perform all transformations on a copy.
3. Use formula-driven solutions wherever possible. Manual typing of results will not be accepted unless a question explicitly requires interpretation.
4. Format all outputs neatly: consistent headers, visible grid organization, readable column widths, and proper number formats.

Assignment Tasks

Complete the following tasks in order. Present formulas clearly and keep your workbook organized.

1.	Remove duplicate rows and create a clean master sheet.
2.	Count blank cells in each column using COUNTBLANK.
3.	Create a Rating Category field using IF logic: 4.5+ = Excellent, 4.0-4.49 = Good, below 4.0 = Average.
4.	Use ROUND to round User Rating to 1 decimal place in a helper column.
5.	Create a column to flag books with Price above 10 as High Price.
6.	Sort data by Year ascending and User Rating descending.
7.	Use conditional formatting to highlight books with Reviews above 10,000.
8.	Extract the first word from Name using text formulas.
9.	Build a summary table with total books by Genre.
10.	Write 2 observations from the cleaned data.

Data For Assignment Completion

- Use The Provided Data For Completing The Assignment

Submission Expectations

• A clean workbook with formatted sheets.

• A short written summary of key cleaning decisions.

• A genre summary table with correct counts.

Assessment Rubric

Criterion	Weight
Data hygiene	10%
Formula accuracy	40%
Formatting and structure	20%
Insight quality	30%
